31. In the question, two quantities (I) and (II) are given. You have to solve both quantities to establish the correct relation between Quantity (I) and Quantity (II) and choose the correct option.

$x$  and  $y$  are integers

**Quantity I :**  $\sqrt[3]{216x^3 - 2x^4} + 51x$  such that  $8 \leq x \leq 12$

**Quantity II :**  $50y + 3^2 \times \sqrt[3]{64^2}$  such that  $2 \leq y \leq 4$

- (A) Quantity (I) > Quantity (II)  
 (B) Quantity (I) < Quantity (II)  
 (C) Quantity (I)  $\geq$  Quantity (II)  
 (D) Quantity (I)  $\leq$  Quantity (II)

35. The question consists of two statements numbered "I" and "II" given below it. You have to decide whether the data provided in the statements are sufficient to answer the question or not and choose the correct option accordingly.

There are seven consecutive natural numbers. Find the average of the numbers.

**Statement I:** Second largest number is 62.5% more than the smallest number.

**Statement II:** Largest number is 6 more than the smallest number.

- (A) The data in statement I alone is sufficient to answer, while the data in statement II alone is not sufficient to answer the question.  
 (B) The data in statement II alone is sufficient to answer, while the data in statement I alone is not sufficient to answer the question.  
 (C) The data either in statement I alone or in statement II alone are sufficient to answer the question.  
 (D) The data given in both statements I and II together are not sufficient to answer the question.  
 (E) The data in both statements I and II together are necessary to answer the question.

Answer the question based on the information given below: Solve the given equations and answer the questions based on it.

A.  $(a \times a) - 3a - \sqrt{(4a^2)} = -6$

B.  $((b^2) - \sqrt{81b^2}) = -4 \times (5)$

C.  $(c^2 \times \sqrt{625c^6}) / 5c^3 + (4 \times 7) = 39c$

D.  $d^2 - (3 \times 5)d = \{7 \times (-8)\}$
